

JUNE 2020

trip highlight: **RAINBOW LORIKEETS**

The rainbow lorikeet is a species of parrot found in Australia. They live in the rainforest, coastal bush and woodland areas. These birds make a range of screeching and chattering noises to communicate with one another and breed from June to January. They also mate for life!

These parrots primarily feed on nectar and pollen gathered from trees and shrubs. They also eat fruits, seeds and the occasional insect. They can travel up to 64km (40miles) a day to find food. Some wildlife sanctuaries allow people to feed these birds with specially prepared mixes. This is something that you can look forward to experiencing on your trip!
